

Connect a mobile programming device via USB with a computer

If a master key system number is lasered on your mobile programming device, it is system-specific.

If you want to connect this mobile programming device to a PC/laptop via USB cable, a driver is required. You can find this here:
www.assaabloy.com/de/en/service

The mobile programming device then uses the computer's internet connection.

The system-independent mobile programmer does not require a separate Windows driver.
