CLIQ® FAQs

What's the difference between a release and a patch for the CLIQ Local Manager?

Releases:
These contain new functions in the software as well as adjustments in the event of a possible change of operating system. New releases always require a new licence.

Patches:
These only contain bug fixes for existing functions. The patches can be applied without a new licence.

Visually, you can easily distinguish a release from a patch. With a release change, the first number of the version number is always changed. With patches, on the other hand, only the back numbers change.

Example:
You have installed a version 1.7.2.

- A patch would be the version 1.7.3.
- A release would be the version 2.0.1.
