

Can various administrators have different rights within the software? (multi-client capability)

Both in the CLIQ Local Manager software and in the CLIQ Web Manager software, it is possible to create additional users with additional programming keys. The rights of these users can then be restricted by the main administrator (PR01).

The CLIQ Local Manager software is a single-user solution. Nevertheless, it is possible for different users to use this software. For this purpose, another programming key is issued to one person and the software automatically creates a new user. The rights must then be assigned in the user list of the settings. This makes sense especially for holiday replacements when identical rights to the main administrator are not desired. The reprogramming of certain cylinders by other users can also be prevented.

With the CLIQ Web Manager software, several users can access the software simultaneously. Here, through the different rights and possible differentiated roles, the interface of the software is simultaneously adapted for the respective user. For this purpose, a programming key must be issued to a person and a role assigned for the programming key.
