

What must be taken into account when using the vandalism proof wall programming device with potential-free output?

A vandalism proof wall programming device with potential-free output can, for example, control swing doors, barriers or gates. This function must be explicitly specified when ordering the wall unit.

In order to be able to use this function for the VERSO CLIQ and +CLIQ systems on site, the E3 keys require firmware 16.3.7. A key firmware update may be necessary for this.

Please order the key firmware via your CLIQ partner.

The description of the procedure for a firmware update for keys can be found in this [FAQ](#)
