The optimal solution
is an IKON brand
product.

Project reference:

AUERBAU apartment building secured with eCLIQ electronic locking system

Barbara Auer,
AUERBAU
GmbH & Co. KG:

"As designers and constructors of residential spaces, it is important to us that the owners get a home where they feel comfortable and secure once the keys have been handed over. The eCLIQ electronic locking system is therefore an optimal solution for our requirements. It has already proven itself in several buildings in the event of key loss and has reduced costs and stress for owners/users."

Characteristics:

Project:	Residential complex with 15 residential units from AUERBAU GmbH & Co. KG, Rosenheim
Category:	Housing industry
ASSA ABLOY components:	eCLIQ master key system of the IKON brand with 19 cylinders and the CLIQ® Local Manager management software
ASSA ABLOY partner:	Schliesswerk Bayern GbR, Stephanskirchen

Challenge:

Since it was founded in 1936 by the master bricklayer and bridge builder Sebastian Kink, AUERBAU has been built over several generations. To this day, the family-owned company is successful in the Rosenheim district and creates customised residential properties and real estate from project development to completion. The portfolio ranges from contemporary new

construction for families and couples to complex commercial properties and to challenging renovation work on listed buildings.

For the new residential complex project in Rosenheimer Burgfeldstraße, the company was looking for a locking system that would meet its requirements for a flexible, secure solution.

Solution:

AUERBAU opted for an electronic master key system from the IKON brand to equip the buildings with 3-7 residential units. eCLIQ was selected, as the system has already been proven in three other residential buildings from AUERBAU. The master key system is easy to use and access authorisations can be assigned flexibly.

technology can be integrated discreetly in the building.

The CLIQ® Local Manager is used to manage the eCLIQ master key system. The user-friendly program is installed locally on the PC and is therefore perfectly suited to the requirements of an efficient housing management.

Another argument was the easy installation, as no wiring is required on doors and components. The power supply is provided by a standard battery in the reversible key. This means that the cylinders do not protrude and the security
